No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to disgnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wntt-Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-SEP-1998;

                                                                             This invention describes a novel human conductin protein which has anti-tumour activity. Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradatio resulting in blockade of the Wntt-Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2701

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                Nucleic acids encoding mutant and wild type Axin and oligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is likely to develop cancer (including breast, colorectal, gastrointestinal, esophageal, carcinomas or melanomas). The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through negative regulation of the Wnt pathway in the Nieuwkoop Center.

detecting, diagnosing

and

treating

```
Nucleic acids encoding mutant and wild type Axin and coligonucleotides derived from them are useful for detecting ultations in the Axin gene and for determining whether a subject is likely to develop cancer (including breast, colorectal, The wild gastrointestinal, esophageal, carcinomas or melanomas). The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Best Local Similarity 51...

Cancer calls and comparing the unrent to inhibit cancer colls against the polypeptides and then administered back to the polypeptides and antibodies cancer cells are received to another back to the patient to inhibit cancer to inhibit cancer development. CD4+ and/or CC nucleic acid of the invention, or an APC expressing such a polypeptide, or closes the proliferation of specific T-cells. The T-cells can be CC cloned and then administered back to the patient to inhibit cancer CC development. Nucleic acids encoding the polypeptides and antibodies cagainst the polypeptides may be used to determine the expression level concer cells are present. Such diagnostic methods may also be used to cancer cells are present. Such diagnostic methods may also be used to present sequence represents a cDNA encoding a human colon tumour The progression of a cancer by repeating the processes at time of the invention and therefore to determine the time intervals, and comparing the current result to previous results. The present sequence represents a cDNA encoding a human colon tumour
                                                                                                                                                                                                                                                                                                                                                                Sequences A77722-A78199 represent 478 cDNAs encoding proteins or portions of proteins which are associated with human colon tumours. The invention also specifically discloses 8 human colon tumour proteins (B11897-B11904). The nucleic acids, the polypeptides they encode, and antigen presenting cells (APCs, preferably dendritic cells) expressing such polypeptides may be used in vaccines that target tumour cells, especially colon tumour cells, thereby inhibiting the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New colon tumor polypeptides especially colon cancer, and

                                                                                                                                                                                                       CC portions of proteins which are associated with human colon tumours.

CC The invention also specifically discloses 8 human colon tumours.

CC (B18897-B11904). The nucleic acids, the polypeptides they encode, and cantigen presenting cells (APCs, preferably dendritic cells) expressing colon tumour cells, thereby inhibiting the development of color cancer. T-cells specific for the polypeptide expressed by the APC are used to remove tumour cells, thereby inhibiting the development of color cancer. The sample or the isolated T-cells specific for the polypeptide expressed by the APC are colored to remove tumour cells from biological samples, especially blood or cractions thereof. The sample or the isolated T-cells specific for the polypeptide can then be used to inhibit cancer development. CO4+ and/or color T-cells from a patient may be incubated with a polypeptide or colored and then administered back to the patient to inhibit cancer colored and then administered back to the patient to inhibit cancer colored and then administered back to the patient to inhibit cancer colored and then administered back to the patient to inhibit cancer comparities and the polypeptides and antibodies against the polypeptides may be used to determine the expression level concer cells are prosesent. Such diagnostic methods may also be used to concer cells are progression of a cancer by repeating the processes at time color two professions of a cancer by repeating the processes at time color versions results. The color present sequence represents a cDNA encoding a human colon tumour color tumour color tumour cells and comparing the current result to previous results. The color present sequence represents a cDNA encoding a human colon tumour color tumour color tumour color tumour color tumour cells and comparing the current result to previous results.

                  Recombinant production of PIGI-1 allows the study of the structure, function and role in oncogeness of the protein. PIGI-1 and nucleic acid encoding it can also be used to develop products for use in treating tumours and cancer and in the diagnosis of cancer.
                                                                                           New isolated nucleic acid encoding p53 response protein PIGI-1 used to develop prods. for the study, diagnosis and treatment tumours and cancer

CR1 expression is rapidly and transiently induced by IL-2, and mRNA expression is suppressed by elevated intracellular cAMP. It encodes an intracellular protein (M08133) that shows homology to GOS8 and BL-34. CR genes and polypeptides (W08133-40) can be used as diagnostic or therapeutic agents; CR gene sequences can be used to detect and treat allelic mutations.

The products of the invention have cytostatic, anti-allergic, immunosuppressive and antimicrobial activity. The antibodies are useful as therapeutic agents for regulating cellular proliferation and differentiation and for treating all kinds of cancers, immune diseases such as allergic, autoimmune, and rheumatologic diseases, transplant rejection, and as anti-infectives for fighting viral, bacterial, parasitic and fungal infections. This sequence encodes

This invention describes a novel isolated antibody or antibody fragment (I) which selectively binds to a polypeptide encoded by cytokine response gene 2 (CR2) and modulates CR2 activity. The products of the invention have cytostatic, anti-allergic, immunosuppressive and antimicrobial activity. The antibodies are useful as therapeutic agents for regulating cellular proliferation and differentiation and for treating all kinds of cancers, immune diseases such as allergic, autoimmune, and rheumatologic diseases, transplant rejection, and as anti-infectives for fighting viral, bacterial, parasitic and fungal infections. This sequence is presented in the Seq ID list but is not described in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CR2; human; antibody; cytokine response gene; cytostatic; anti-allergic; immunosuppressive; antimicrobial; therapy; cell proliferation; treatment cell differentiation; cancer; immune disease; rheumatologic disease;

The encoded protein participates in the regulation, control and/or modulation of G-protein mediated signal transduction, involved in T cell activation, including T-helper (TH) cell and TH cell subpopulation activation. The protein can be used to develop products for treating autoimmune disorders, arthritis, graft rejection, asthma, allergy, infections or neoplasms.

The encoded protein participates in the regulation, control and/or modulation of G-protein mediated signal transduction, involved in T cell activation, including T-helper (TH) cell and TH cell subpopulation activation. The protein can be used to develop products for treating autoimmune disorders, arthritis, graft rejection, asthma, allergy, infections or neoplasms.

roles in immune responses, cell death, cell proliferation and stimulation of cell differentiation. M68 lacks a transmembrane domain and is a secreted factor suggesting that it functions as a natural inhibitor for its ligand. The altered expression pattern of M68 in a multitude of tissues suggests that M68 may play a role in cancer by binding to its ligand and blocking apoptotic cell death induced by such a ligand. This anti-apoptopic role of M68 suggests that modulators of M68 will be useful in treatment of apoptosis related diseases such as various forms of cancer and various bone disorders. M68 nucleic acids and proteins are therefore useful for treating conditions involving atypical apoptosis and for identifying modulators of M68. Modulators of M68 are useful for treatment of cancer and other diseases associated with abnormal levels of cancer and other diseases associated with abnormal levels of

The

The promoter enhances gene expression in roots and can be used to confer disease resistance or immunity upon a susceptible plant root by transforming the plant with a composite gene capable of abundant expression in the gene, comprising the promoter and the gene of interest. This method can be used to transform plants, partic food crops that have roots susceptible to fungal or insect diseases. The roots of the transformed susceptible to fungal or insect diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Brassica root-specific promoter sequence and vectors containing it -                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleic acid is provided in antisense orientation, the transgenic plant is used to prevent removal of a heavy metal from soil. When the nucleic acid is provided in sense orientation, the transgenic the nucleic acid is provided in sense orientation, the transgenic plant is capable of removing a heavy metal from soil or groundwater, the heavy metal being e.g. cadmium, arsenate, arsenite, mercury, lead, zinc, nickel, bismuth, selenium, silver, gold or copper. PCS nucleic acids can also be used to decrease the level of heavy metal in the harvestable portion of a plant by expressing PCS in a non-harvestable portion and involves inhibiting expression of PCS in the harvestable portion of the plant. PCS polypeptides are used for in vitro or in vivo biosynthesis of phytochelatins, and in a method of transferring a gamma-glutamylcysteine unit from 1 thiol peptide to another. The methods allow cost-effective and efficient bioremediation of contaminated soils and groundwaters, as well as the plant of the plants.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 expressed in yeast. The cDNA was obtained from a screening assay designed to identify genes that conferred tolerance to cadmium. Phytochelatins play major roles in metal detoxification in plants. Phytochelatins provides PCS nucleic acids (see A89183-97) and enzymes (see B1934-38) from Arabidopsis, wheat, yeast and nematode. The nucleic acids are used to generate transgenic plants. When the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of cDNA encoding TaPCS1 (see B19936), a novel wheat phytochelatin synthase (PCS) that is capable of high rates of Cd2+-activated phytochelatin biosynthesis from glutathione, and which confers strong cadmium tolerance when
